

Figure 2: Pre-treatment digital casts. Pre-treatment digital casts show a Class II molar and canine relationship on both sides with a severe deep bite. The maxillary dental arch shows a reverse Curve of Spee and the mandibular dental arch shows an accentuated Curve of Spee. Both maxillary and mandibular dental arch widths were constricted. Severe crowding was found in both dental arches. A Bolton discrepancy due to a maxillary excess was also observed. A buccal crossbite was present on the maxillary right second molar. Measurements indicated a cant of the incisal plane elevated on the left side.
