

**Figure 5: Post-treatment and intra-oral photographs.** Post-treatment photographs demonstrate an improvement in the facial profile, with an increase in the lower facial height, improved smile esthetics, correction of the incisal plane cant, and improved maxillary and mandibular lip position. Intra-oral photographs show maxillary and mandibular arch development, aligned dentition in the maxillary and mandibular arches, normalized incisal inclination into an ideal overjet and overbite relation, and Class I molar and canine occlusal relationship on the left side. Both maxillary and mandibular dental midlines are aligned with the facial midline. Gingival margins and heights of contour improved around the anterior teeth. Lingual fixed retainers are shown extending from canine to canine in both arches.
