

**Figure 5: Post-treatment portrait and intra-oral photographs.** Post-treatment photographs demonstrate improved facial profile, maxillary lip position, smile esthetics, and correction of open bite. Intra-oral photographs show maxillary and mandibular arch development, aligned dentition in the maxillary and mandibular arches, normalized incisal inclination into an ideal overjet and overbite relation, and Class I molar and canine on both sides. Both maxillary and mandibular dental midlines are aligned with the facial midline. Gingival margins and heights of contour improved around the anterior teeth. Lingual fixed retainers are shown extending from canine to canine in both arches.
