

Figure 2: Pre-treatment panoramic radiograph. Panoramic radiograph shows a complete dentition except for maxillary first premolars and mandibular second premolars. Roots on all teeth were fully developed and showed mild to moderate root resorption on the anterior teeth and the maxillary premolars. Bone loss is clear around the mandibular anterior teeth and the maxillary canines. Asymmetric condyles showed some degree of remodeling and flattening on their anterior surface. Mandibular morphology shows prominent and asymmetric gonial angles with some degree of remodeling on the left side. Nasal polyp is visible along the medial wall of the left nasal cavity.
